

Google's Firebase Instructions

Perquisites:

- You'll need to have a Gmail Account or a Firebase account for this portion of the project to work.
- You'll also need to install firebase libraries using **npm install firebase** or **npm install** to get a working package list for this project.

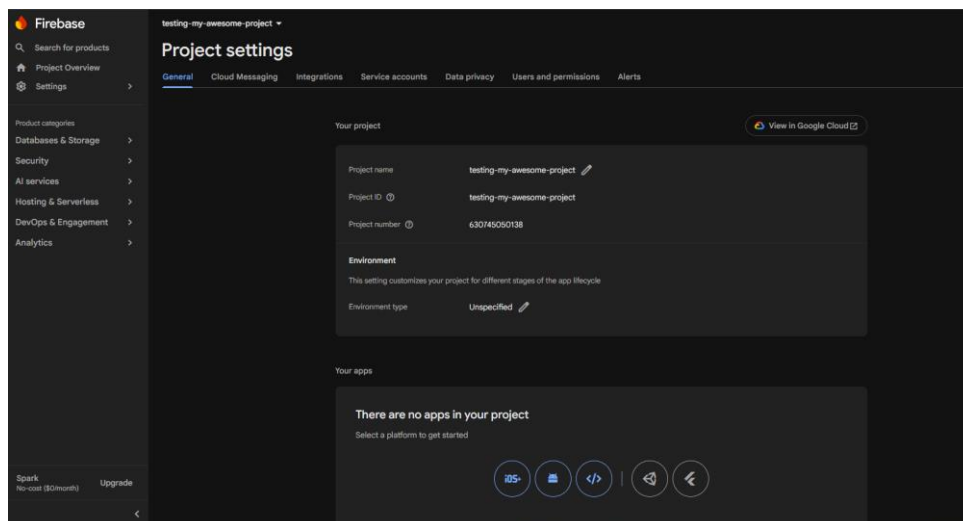

>> Instructions

Go to console.firebase.google.com and create a Firebase Project

You'll need to add your Firebase configurations so on the dashboard to the left select Settings > General then click on the Web Icon . Once done create a name for your app i.e. "cs504-super-awesome-project" to generate your

firebase configs.

Your configuration file should look something like this.

2

Add Firebase SDK

☒ Use npm ☐ Use a <script> tag

If you're already using [npm](#) and a module bundler such as [webpack](#) or [Rollup](#), you can run the following command to install the latest SDK ([Learn more](#)):

```
$ npm install firebase
```

Then, initialize Firebase and begin using the SDKs for the products you'd like to use.

```
// Import the functions you need from the SDKs you need
import { initializeApp } from "firebase/app";
import { getAnalytics } from "firebase/analytics";
// TODO: Add SDKs for Firebase products that you want to use
// https://firebase.google.com/docs/web/setup#available-libraries

// Your web app's Firebase configuration
// For Firebase JS SDK v7.20.0 and later, measurementId is optional
const firebaseConfig = {
  apiKey: "AIzaSyBIsxaa4vgCp4VU8KnW__pkz20IQxlh4o0",
  authDomain: "personal-test-50fbf.firebaseio.com",
  projectId: "personal-test-50fbf",
  storageBucket: "personal-test-50fbf.firebaseio.com",
  messagingSenderId: "198697059602",
  appId: "1:198697059602:web:17622ce1154d9415241fcb",
  measurementId: "G-Y8L86HKVGH"
};

// Initialize Firebase
const app = initializeApp(firebaseConfig);
const analytics = getAnalytics(app);
```

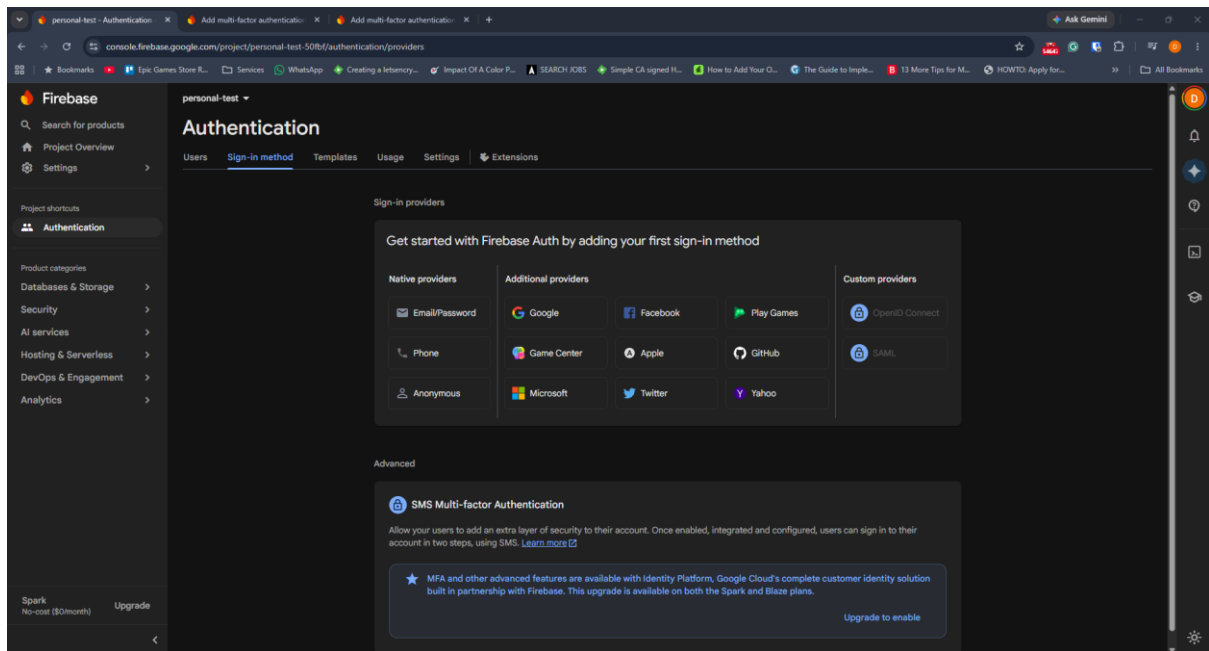

Note: This option uses the [modular JavaScript SDK](#), which provides reduced SDK size.

In the Project folder under firebase-demo > src > app, there should be a firebase.js file where you can copy the contents to.

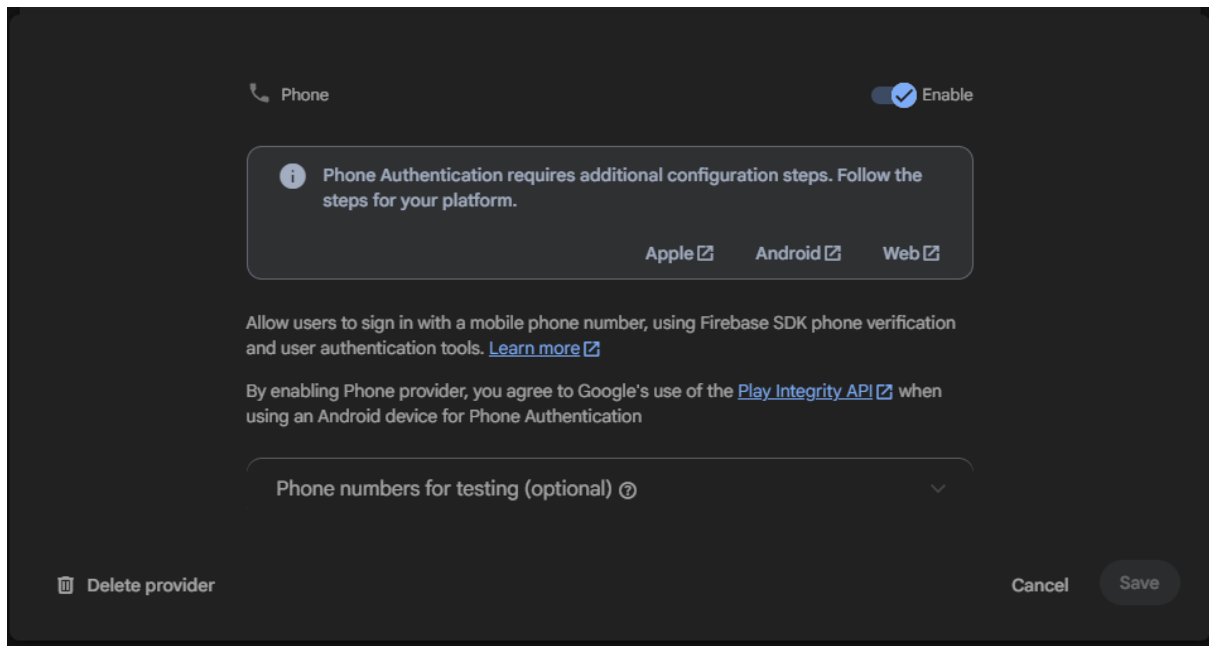

****NOTE:** Make sure that firebase is installed per the instructions given by this window. If this is a new clone, you should be able to use **npm install** to get the latest build from the package.json file that include in this build of the project.

1. From the Firebase Console on the Web Browser, go to Authentication and on the Sign-in method tabs enable Email/Password and Phone

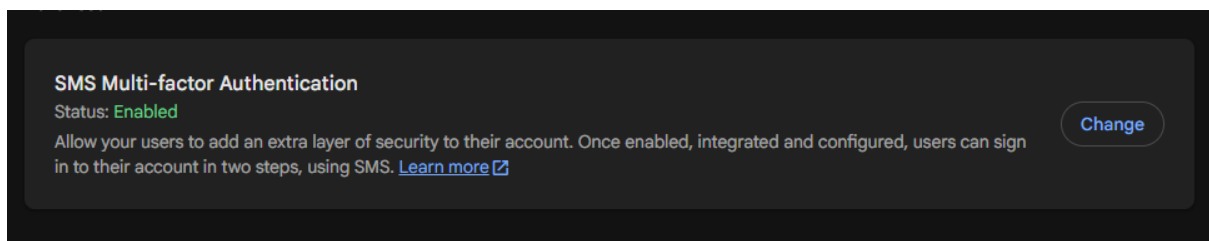

For the Email/Password portion, make sure to disable Email Link as we'll be using a generated pin code for testing.

Towards the bottom, make sure to Enable SMS Multi-factor Authentication. You'll need to go through the Upgrade process if you don't haven't enabled it already.

Once done, select change and add your phone number and a 6 digit verification code for testing.

SMS Multi-Factor Authentication

☒ Enable

SMS based multi-factor authentication requires additional configuration steps. Select your platform to view configuration instructions.

User account linking

When a user signs in using different identity providers, you can choose to automatically merge accounts on sign in. [Learn more](#)

☒ Link accounts that use the same email

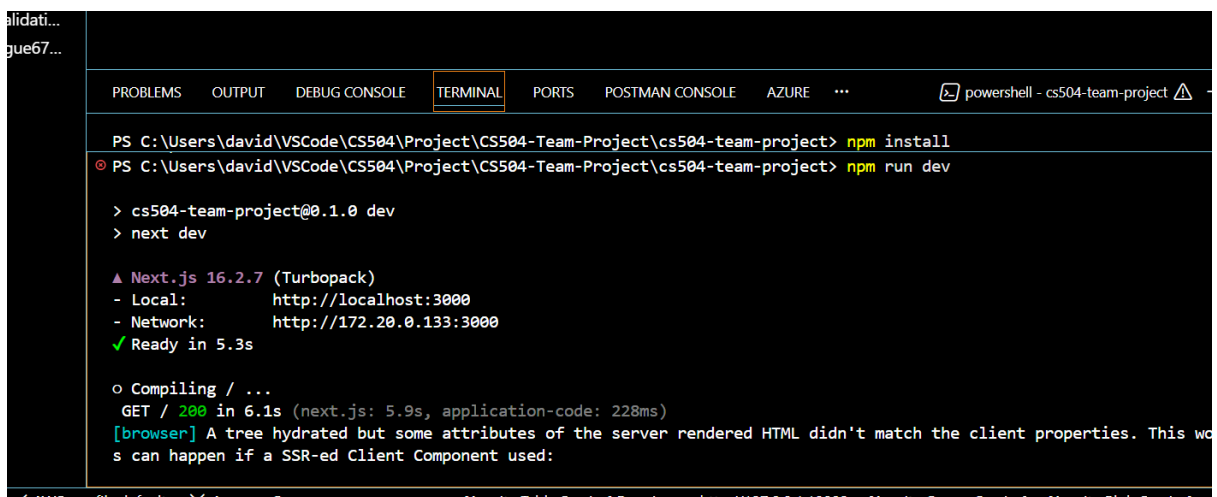

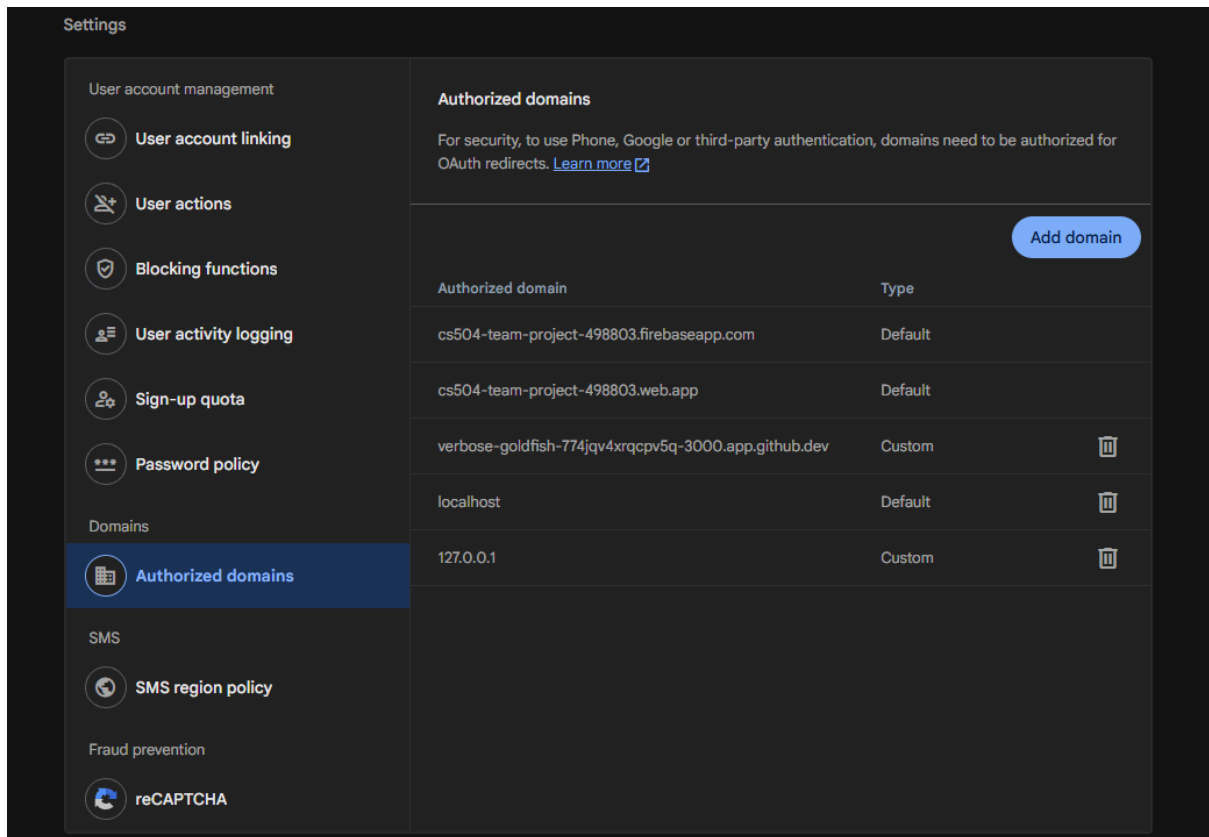

☐ Create multiple accounts for each identity provider

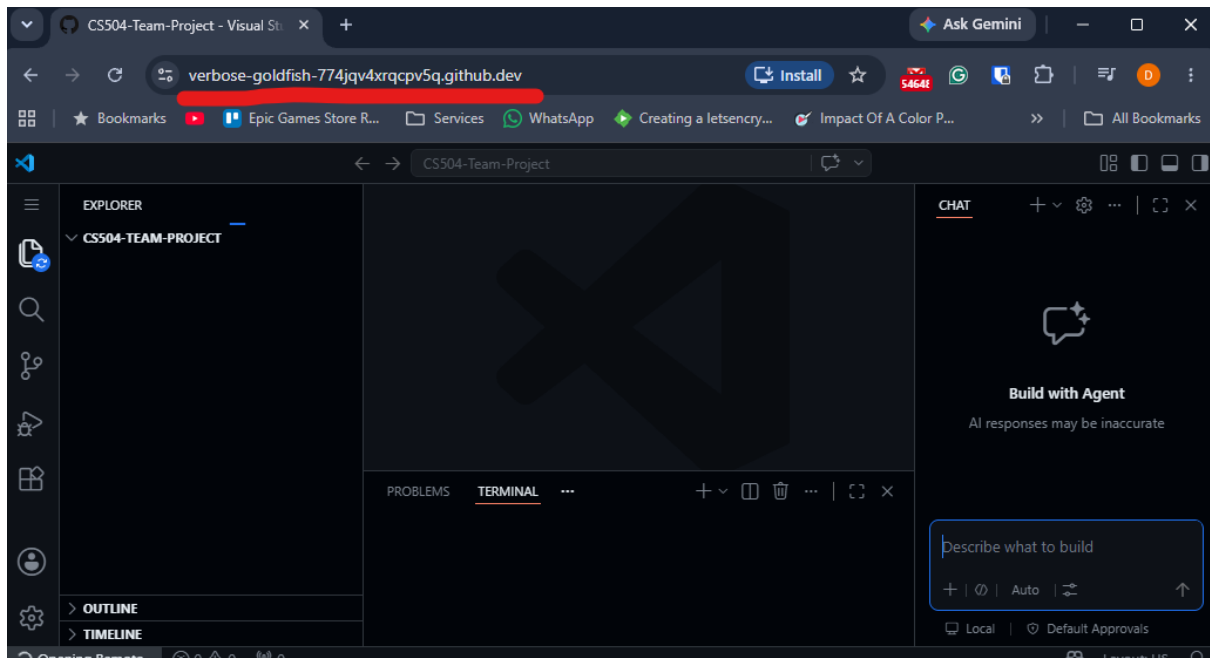

Save

Here you'll need to authorize the domains that you're using.

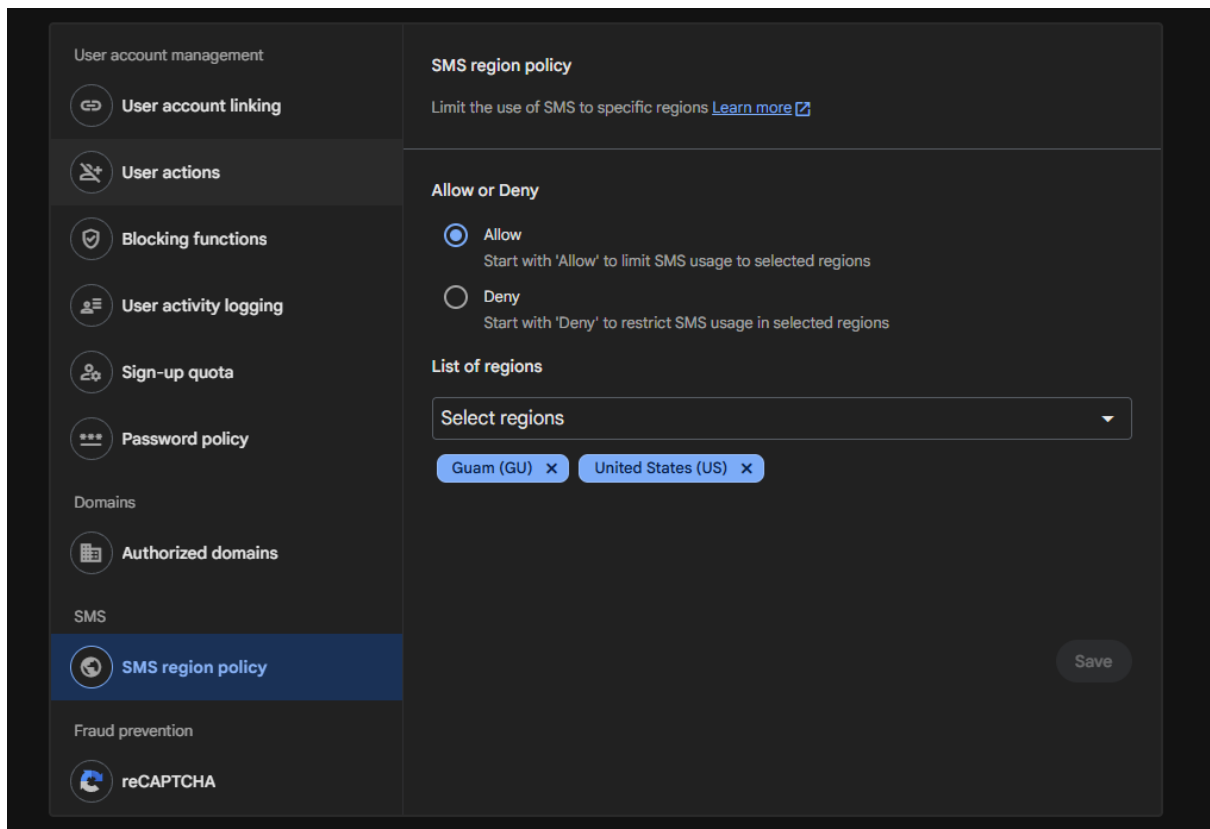

For example, if you're running this project on you local environment, make sure to add localhost, 127.0.0.1, and/or whatever ip scheme your network is using.

Otherwise, if you're using an online environment like GitHub Codespaces, you'll need to add the domain that the Codespace is utilizing to run this project.

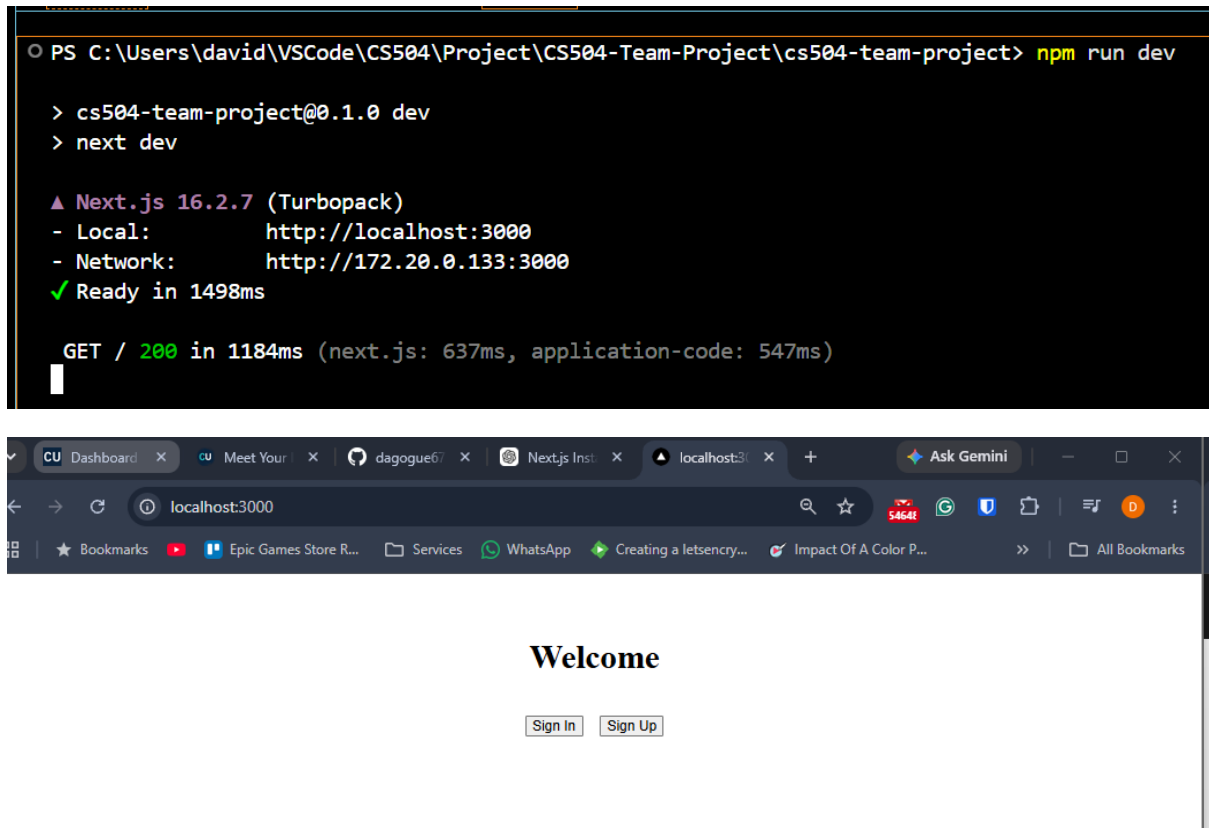

Next go to the SMS region policy and make sure to add the List of regions allowed for SMS. In my case, I need to add both Guam and the United States, depending on how my Service Provider handles Phone Numbers.

Now run the project using **npm run dev** in the project folder. Once you run it, open up your web browser to the project page and start the Sign Up Process. Once you sign up, you should get a message saying to verify your email account. Go to you inbox and click on the verification link to verify you account.

Hello,

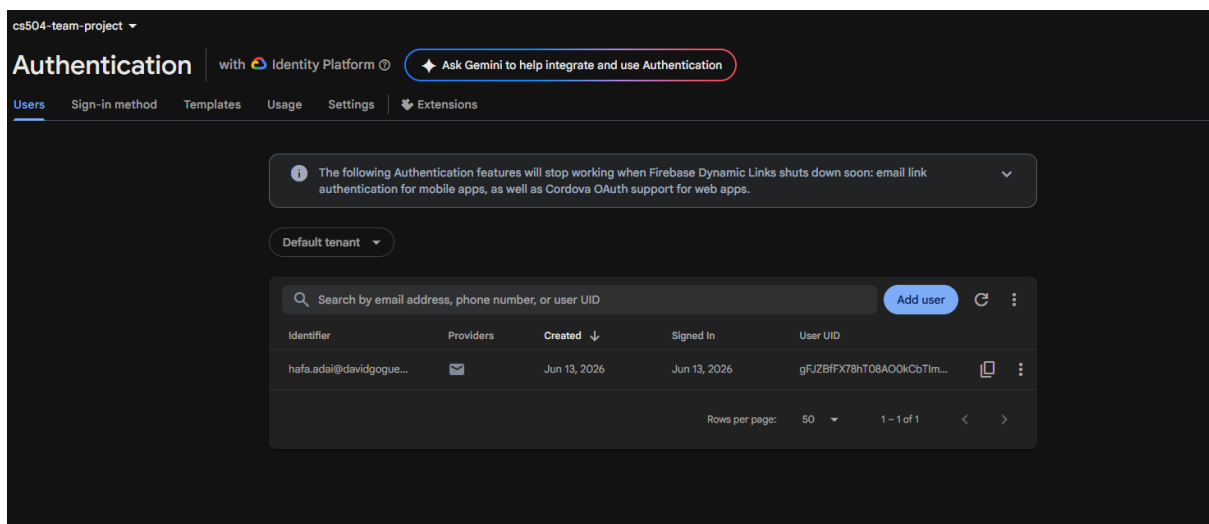

Follow this link to verify your email address.

https://cs504-team-project-498803.firebaseio.com/_/auth/action?mode=verifyEmail&oobCode=QcA1249aKbF-A5Lx95QG4u2rJ51owrfxyPEwFW0pfbAAAAAGev2vZRw&apiKey=AlzaSyD49aM0QYwN19oA1gR0fz2byQxNbWpiLPQ&lang=en

3 deleted messages in this conversation. [View messages](#) or [delete forever](#).

You should note that when you sign up, your email account gets saved in the Authentication page of Firebase. Only verifying your account, will allow you to continue with the MFA process, so please check your SPAM/Junk folder. You should get an email with the name of your project space as your domain.

Once you verified your email, click on the **I verified my email** button, to go to the next steps of the MFA process.
